NONCONFORMIST — hell YEAH, technical sound breakdown

Problem

Know the tempo, meter and the character of each sound layer before prompting or re-producing the track.

Instant solution

Parameter	Value
Tempo	**~126 BPM** (estimate from audio)
Meter	4/4
Primary identity	minimal / tribal techno
Vocals	none — instrumental

Key structural event: at **~24 s** into the snippet the low-frequency energy rises substantially — the groove gets heavier and fuller. Preserve this in any reconstruction.

Sound element	Character to reproduce
Kick	tight, steady, increasingly prominent four-on-the-floor pulse
Bassline	deep, elastic, repetitive electronic bass
Synth motif	rounded, hollow, short repeating notes, rubbery / resonant
Percussion	layered toms, woody clicks, metallic hits, rolling fills
Groove	syncopated, densely interlocking but danceable
Atmosphere	dark, slightly futuristic, playful, hypnotic
Evolution	gradual layer additions, percussion variations, low-end reinforcement

Why it works / gotchas

- 126 BPM and the ~24 s shift are **estimates from the 37.9 s snippet**, not the original DAW project settings — check the project file if it still exists.
- The snippet is ~8 % of the 7:38 track; the full arrangement is not transcribed here.
- Build order in the snippet: synth + percussion first, low end later. Reversing it loses the "arrival" feeling.

Diagram brief

- Type: layered stack + timeline.
- Left: frequency stack bottom → top: Kick · Bassline · Synth motif · Percussion (toms, clicks, metal) · Atmosphere.
- Right: timeline 0 → 37.9 s, energy line flat-ish then a clear step up at ~24 s labelled "low-end arrival".

- Header chips: ~126 BPM · 4/4 · instrumental.
